

Demo project React / GraphQL

Use typescript on backend / frontend

Start a project from Create React app.

Use Redux toolkit <https://redux-toolkit.js.org/>

Create a login flow

- Signup user interface
- Login interface
- Reset password

Create a user interface with a list of items (title, created_at) and the user who created them. The user must be able to add a new record and the list should update to reflect the change, without a page refresh.

Use GraphQL with node.js backend and sequelize as an ORM (<https://sequelize.org/>)

For database, you can use sqlite (or you can chose the one you want)

Please use github for git repository and you will share the repo with danyb@bannersnack.com and laviniu.olaru@bannersnack.com
